

**ABSTRACT OF THE DISCLOSURE**

5 Replacing fluid in a sealed system interconnected by fluid conduction tubes with a lower  
port of a spent fluid container and a lower port of a new fluid container. A fluid pump is  
interconnected by the fluid conductors in such manner as to suck air from an upper port of  
the spent fluid container, thereby urging spent fluid from the system into the spent fluid  
container, and simultaneously forcing air into an upper port of the new fluid container  
thereby urging new fluid into the system to replace the spent fluid.
